

## DON'T GO WITH THE FLOW

### *Untreated sewage is polluting our ocean*

Sewage damages coastal habitats, threatens human health and impacts our economy. It is the most significant form of marine pollution in the Maldives

Globally, almost two thirds of tropical coral reefs are thought to be exposed to nitrogen from wastewater

But many island communities have no option other than disposing of their waste into the sea

### **What can you do?**

- Talk to your island council or write to your parliament representatives
- Tell them you want proper sewage treatment to be compulsory by law
- Demand that the people in charge work together to balance environmental and human health priorities
